Punch**PRO**

The production planning software for
optimized material use

EHRT

PunchPRO

Your material is worth it!

The production planning software PunchPRO expands the proven software solutions of EHRT punching and bending machines.

PunchPRO easily integrates into your ERP system. Your production list enables PunchPRO to quickly calculate the optimized use of raw materials for your workpieces. The nesting software avoids waste of long scrap pieces, so your punching machine can utilize materials in the most cost effective way.

PunchPRO considers all relevant product information – even the cut length for the bending process.

It automatically sorts the assignments and optimizes the entire production process. PunchPRO can increase the utilization of the machine, the material, and raise productivity. The software is automatic and easy to use and manual intervention is always possible. The use of materials is documented for every job, which makes the process easy to understand. After the production you get evaluations and reports on production material usage and production times.
